• Scan for viruses in local drives, custom folder, or file • Support for heuristic detection • Deactivate/enable heuristic detection option • Detect viruses and clean them • View infected and removed files in a list • Set log folder and log filter for logs • Automatic and manual update • Manual removal of files • Manage and run scheduled tasks • Send

immediate email report • Support for almost all antivirus engines • Command line interface is available • Can be installed on Windows 8.1, 8, 7, Vista and XP • Mac OS X: El Capitan and iOS Did the Author verify the company, the fact that the review of the software is not the work of an independent blogger or by an anti-virus manufacturer? Here is a better explanation of what is a review from a blogger or a

software manufacturer. An anti-virus and protection software that ensures that your computer is as secure and clean as possible, with some diagnostic features. According to the information provided by the company, Little Intelligent Antivirus consists of the following features: A blacklist and a whitelist of antivirus engines that may hinder the tool to recognize viruses and other malicious programs. You can use either of these two

techniques to detect the virus in your local machine, either through a window that, after the installation, opens automatically or by forcing you to download it on your desktop. You can download a version that only scans files or even a version in which the installation even generates a virus. Several support modes: the normal scanning, which is executed in the background, the heuristic detection, in which the virus signature is

searched to identify the virus signature, that is the possible indicator of a malicious program, the quarantine, that is the area on the system of the user that must remove the virus or file, the user action, in which the virus detected and deleted the person, and the report, with which the vendor can send you a personal report. The scanning is really slow. The software lacks feature to monitor and/or control the

auto updates. The software does not have a help manual to help the users of the tool. Only some basic configuration settings are provided. The product as a whole lacks most of the interesting features that make the anti-virus an absolute necessity for all those who use computers. Most of the security measures provided by Little Intelligent Antivirus fail to recognize viruses. Little Intelligent Antivirus

=============== Little Intelligent Antivirus is a free program capable of detecting and removing malware from your computer that helps protect against viruses, spyware, Trojans and other malicious software. It is designed to run alongside existing antivirus software and should be automatically installed in systems that already have an antivirus

application installed. The application's function is based on two antivirus programs - ClamWin for finding and removing Windows viruses and Ransomware. * Scanning your system for malware* Helping you remove them* Detecting and removing viruses* Removing trojans and spyware* The ability to integrate with antivirus apps and detect new threats * Identifies and removes malware* Does not use

spyware* Can be integrated with antivirus apps such as anti-malware apps* Protects the computer against fake websites The application comes with a concise interface that does not require user interaction. All the functionality is easy to access by using the main options. You can download L.I.A.V on your computer and, if needed, uninstall any previously installed antivirus that it may conflict with. Little Intelligent Antivirus is

not compatible with all antivirus apps, hence it will not remove them. In case the antivirus application is hidden, then it will not be removed. It can be easily discovered in the system settings. Little Intelligent Antivirus History ======= ================== =========== Little Intelligent Antivirus was initially created in 2004, with the title of SoftSPOT Antivirus. It was a free application that offered file,

email, and web protection against virus infection. Its popularity increased very quickly. L.I.A.V was able to detect and remove several viruses. However, security researchers found out that it was a security threat and used fake antivirus software that was able to hijack the system without permission and redirect it to dangerous sites. In 2006, when it was called QuickPCFix, the product became more popular due to its simplicity

and friendliness with PC users. In addition, the developers optimized L.I.A.V to be faster and more resource-friendly. At that time, the price was cheap - $20 for personal use. In 2012, the name was changed to Little Intelligent Antivirus, an improvement in the product's features and overall performance. The price was set at $49.95 and it was a reliable product that was able to detect and remove malware and viruses

from Windows computers. Little
